

Product Management Internship Assignment

Scenario: The Economic Times is launching a 3-hour online AI Masterclass for Business Professionals.

My approach	I would treat this as one funnel: acquire the right audience, help them attend and get value, collect feedback during the experience, and only then ask them to buy. Registrations alone are not a useful success measure if intent and attendance remain weak.
-------------	---

1. Go-to-market plan

Target audience

- **Primary:** managers and functional professionals in marketing, sales, finance, HR and operations who are interested in AI but do not know how to apply it in daily work.
- **Secondary:** founders, consultants, analysts and early-career professionals who need practical AI workflows rather than technical model training.
- **Need state:** "I know AI matters, but I need to see where it saves time in my role." I would target this need instead of the broad label of "business professional."

Channels I would prioritise

Priority	Channel	How I would use it
1	Meta Ads - Instagram and Facebook	Reels for awareness; role/interest targeting, lookalikes and retargeting for scale. Test hooks by profession and use case.
2	Google Ads - Search, Display and YouTube	Capture high-intent searches such as "AI course for managers" and retarget video/site visitors across the decision journey.
3	ET owned channels - site/app, newsletters and push	Use ET's trust and existing professional audience to generate qualified registrations at lower acquisition cost.
4	LinkedIn	Speaker posts, short workflow demonstrations, creator partnerships and lead ads in a professional context.
5	Email and WhatsApp	Confirmation, calendar commitment, reminders, feedback and behaviour-based follow-up - not only promotion.
6	Partners	Companies, business schools and professional communities for qualified cohorts and group participation.

One creative idea: "Adapt with AI" Reel + AI Workday Score

Run a short Reel showing two professionals doing the same job. One ignores AI, struggles with repetitive work and is eventually replaced when the role changes; the other learns to use AI, completes the work faster and moves into higher-value decisions. The ending message is: **AI may not replace every professional, but professionals who use AI will have an advantage over those who do not.** The Reel leads to a short AI Workday Score that identifies where the viewer loses time and gives one sample prompt. Registration unlocks the live workflow session, while a referral unlocks the full prompt pack. This uses urgency, but ends with a practical action instead of fear alone.

2. Product thinking

Funnel snapshot

5,000	2,000	150	40%	7.5%	3%
Registered	Attended	Purchased	Registration to attendance	Attendance to paid	Overall conversion

What the numbers do and do not show: The largest visible loss is before attendance: 3,000 registrants did not join. However, the aggregate funnel does not prove whether the main paid-conversion problem is traffic quality, content, price, offer exposure or checkout. I would first split it by channel, persona, registration date, engagement and feedback.

Possible reasons for drop-off

Stage	Possible reasons
Registered but did not attend	Low commitment from free registration; long sign-up-to-event gap; inconvenient time; weak reminders; unclear outcome; competing priorities; join/device friction.
Attended but did not purchase	Wrong audience; generic or theoretical content; the paid course felt repetitive; outcomes or proof were unclear; price/manager approval barrier; checkout failure; follow-up ignored attendee behaviour or feedback.

Product thinking - continued

I would instrument the full journey, use feedback while the session is still running, and carry the learning into the next masterclass.

Metrics I would track

Stage	Metrics	What it answers
Acquisition	Landing-page conversion, cost per qualified registration, source, persona mix and registration lead time.	Are Meta, Google and other channels bringing the right people?
Attendance	Calendar-add rate, reminder engagement, show-up rate, join success and show-up by source/persona.	Where does commitment or access break?
Engagement	15/60/120/180-minute retention, polls, chat participation and workflow completion.	Did participants remain involved and complete the practical work?
Feedback	Mid-session pulse after each module; end-session usefulness score, confidence lift, content gaps, speaker rating and open-text suggestions.	What should be adjusted live, and what should change next time?
Conversion	Offer exposure/click, checkout start, payment success, attendee-to-paid, time-to-buy and conversion by feedback/engagement.	Is the issue audience fit, offer or checkout?
Guardrails	Refunds, paid-course activation, satisfaction, unsubscribe rate and complaints.	Are conversions producing suitable learners?

Five improvements I would test

#	Improvement and reasoning	Primary metric
1	Capture role and use case at registration. Personalise examples, confirmation copy and follow-up; compare results across Meta, Google and owned traffic.	Show-up and paid conversion by channel/persona
2	Create a commitment loop. Add one-click calendar entry, WhatsApp opt-in and a five-minute pre-work task used in the opening demonstration.	Calendar-add, pre-work completion and show-up
3	Use live feedback between modules. Ask one short poll: "Was this useful?" and "What is still unclear?" The moderator can slow down, change the next example or answer a repeated concern.	Module usefulness and next-module retention
4	Make the paid course decision clear. Show fit, outcomes, syllabus, sample project, instructor proof and what is not covered. Do not depend only on a discount.	Offer click and checkout start
5	Close the feedback loop. End with a two-minute survey and optional interview. Follow up differently with no-shows, early leavers, engaged attendees and checkout abandoners; feed recurring issues into the next session.	Survey completion, paid conversion and repeat-session improvement

What I would do first	Build one channel-by-persona funnel covering ad click, registration, attendance, session retention, feedback, offer exposure and purchase. This would show whether the first problem is Meta/Google traffic quality, attendance execution or the paid offer.
------------------------------	--

3. AI tools and workflow

- **Tool used:** OpenAI Codex (GPT-5) to structure the funnel, challenge assumptions, compare experiments and format the two-page PDF.
- **Why:** The task combines GTM, product, analytics and writing, so one tool allowed fast iteration while keeping the reasoning together.
- **How it helped:** It accelerated drafting. I selected the channels, creative direction, feedback design and priorities, and removed recommendations that were too generic or could not be measured.

Prompts used

1. "Diagnose the 5,000 -> 2,000 -> 150 funnel. Separate what the data proves from what still needs validation."
2. "Design five measurable improvements, including live and end-session feedback, across attendance, engagement and paid conversion."
3. "Rewrite this as a simple two-page assignment in a direct, evidence-first voice. Keep Meta and Google explicit in the channel plan."
